Symmetry as a Developmental Principle in Nature and Art Werner Hahn, 1998 Looking beyond the boundaries of various disciplines the author demonstrates that symmetry is a fascinating phenomenon which provides endless stimulation and challenges He explains that it is possible to readapt art to the sciences and vice versa by means of an evolutionary concept of symmetry Many pictorial examples are included to enable the reader to fully understand the issues discussed Based on the artistic evidence that the author has collected he proposes that the new ars evolutoria can function as an example for the sciences The book is divided into three distinct parts each one focusing on a special issue In Part I the phenomenon of symmetry including its discovery and meaning is reviewed The author looks closely at how Vitruvius Polyclitus Democritus Plato Aristotle Plotinus Augustine Alberti Leonardo da Vinci and Durer viewed symmetry This is followed by an explanation on how the concept of symmetry developed The author further discusses symmetry as it appears in art and science as well as in the modern age Later he expounds the view of symmetry as an evolutionary concept which can lead to a new unity of science In Part II he covers the points of contact between the form developing process in nature and art He deals with biological questions in particular evolution The collection of new and precise data on perception and knowledge with regard to the postulated reality of symmetry leads to further development of the evolutionary theory of symmetry in Part III The author traces the enormous treasure of observations made in nature and culture back to a few underlying structural principles He demonstrates symmetry as a far reaching leading structuring causal element of evolution as the idea lying behind nature and culture Numerous controllable reproducible double mirror experiments on a new stereoscopic vision verify a symmetrization theory of perception

Art & Design Forms 1 and 2, The Visual World of the Child Eliane Vurpillot, 2018-01-29 How do children see the world is a question of immense importance which fascinates not only psychologists but also parents and all those concerned with education In this English translation first published in 1976 the author who was Professor of Psychology at the Ren Descartes University in Paris provided the most comprehensive review at the time of the development of visual perception in children a field to which she herself had made a substantial contribution Her book which gave the first comprehensive study of the relationship between cognitive development and perceptual activities in small children explores how they interpret visual information and gradually build up a picture of the world The author had devoted fifteen years to research on the visual world of the child and possessed an exhaustive knowledge of the experimental literature on the subject in English French Russian and other languages She saw perception as a form of knowledge which the child exploits and adapts in a variety of ways at different stages of development This is brilliantly demonstrated in her own research on the strategies children use in judging things as different or the same and the way these relate to the structure of their perceptual organisation This book is essential reading for anyone with a serious interest in developmental and cognitive psychology it also provides an object lesson in the application of experimental

methods In addition the organisation of the material made it a valuable textbook for advanced undergraduate and post graduate teaching and will still be of interest in its historical context today
