Regression Periods in Human infancy Mikael Heimann, Frans X. Plooij, 2003-10-17 Regression periods play a central role in the psychological development of the human baby Studies of infants have identified 10 periods of regression or a return to a high frequency of mother infant contact within the first 20 months of life These periods of emotional insecurity in the child signal forthcoming periods of developmental advance and the emergence of an array of new skills as a consequence of parent infant conflict over body contact and the renegotiation of old privileges Although the basic idea in this book is an old one the authors believe that regression periods deserve further study and have identified four questions of central importance today Can the phenomenon of regression periods as found by Dutch researchers in 1992 be replicated in other countries and cultures What environmental conditions have an effect on these regression periods and how Are there physical conditions in infants that show a non linear distribution over age similar to regression periods Have brain changes been detected since the review of Fischer Rose 1994 at other ages than the six reported by them and if yes how do these relate to the ages at which regression periods are found Forming the core of this book the replication studies performed in Sweden Spain and England provide support that regression periods are a reliable phenomenon and should be dealt with accordingly whenever developmental processes in infancy are discussed

Infant Perception and Cognition Lisa M. Oakes, 2011 The cognitive revolution in the 1950s and 1960s led researchers to view the human mind like a computer as an information processing system that encodes represents and stores information and is constrained by limits on hardware the brain and software learning strategies and rules The emergence of new behavioral computational and neuroscience methodologies has deeply expanded psychologists understanding of the workings of the infant child and adult mind One result is that research has focused on mechanisms of change over developmental time in the information processing mind In this book Lisa Oakes Cara Cashon Marianella Casasola and David Rakison bring together the recent findings and theories about the origins and early development of the information processing mind and provide insight into the future directions in the study of infant perception and cognition The contributors represent a wide range of research areas in the study of infant perception and cognition who emphasize the use of diverse methodological techniques to address key questions about development Their chapters demonstrate how the combination of historical perspectives on the information processing

approach to cognition and recent advances in behavioral computational and neuroscience approaches to cognition has contributed to our understanding of how abilities ranging from visual attention to face processing to object categorization have developed during infancy Across this broad range of topics it is clear that much of our modern understanding of infant perceptual and cognitive development emerges from the foundation of classic information processing models of development such as that of Leslie B Cohen 1991 The recent advances illustrated in this book show how researchers have built on this foundation to uncover the mechanisms that drive developmental change
