In this paper, we study factorization in an integral domain  $R$ , that is, factoring elements of  $R$  into products of irreducible elements. We investigate several factorization properties in  $R$  which are weaker than unique factorization.

### Introduction

Let  $R$  be an integral domain with quotient field  $K$ . In this paper, we study factorization in  $R$ , that is, factoring elements of  $R$  into products of irreducible elements. The classical situation is when this factorization exists and is unique up to order and associates, that is, when  $R$  is a unique factorization domain (UFD). This case has been studied extensively, and there are many excellent accounts of the theory ([14, 17, 28-30], for example). In this paper, we investigate various related factorization properties weaker than unique factorization. Our goal is to give a careful study of these properties and to give many examples, each as elementary as possible.

We first define the various factorization properties which we will study here. Following Cohn [13], we say that  $R$  is *atomic* if each nonzero nonunit of  $R$  is a product of a finite number of irreducible elements (atoms) of  $R$ . We say that  $R$  satisfies the *ascending chain condition on principal ideals* (ACCP) if there does not exist an infinite strictly ascending chain of principal integral ideals of  $R$ . The domain  $R$  is a *bounded factorization domain* (BFD) if  $R$  is atomic and for each nonzero nonunit of  $R$  there is a bound on the length of factorizations into products of irreducible elements. We say that  $R$  is a *half-factorial domain* (HFD) if  $R$  is atomic and each

Some Results on Factorization in Integral Domains Jack Robert Bennett,2011 In this dissertation we study three recent generalizations of unique factorization the almost Schreier property the inside factorial property and the IDPF property Let  $R$  be an integral domain and let  $p$  be a nonzero element of  $R$  Then  $p$  is said to be almost primal if whenever  $p$  vertical line  $xy$  there exists an integer  $k$  greater than or equal to 1 and  $p_1 p_2$  is an element of  $R$  such that  $p_k p_{k+1} p_{k+2}$  with  $p_1$  vertical line  $x$   $k$  and  $p_2$  vertical line  $y$   $k$   $R$  is said to be almost Schreier if every nonzero element of  $R$  is almost primal Given an  $M$  graded domain  $R$  tensor product of modules  $m$  is an element of  $M$   $R$   $m$  where  $M$  is a torsion free commutative cancellative monoid we classify when  $R$  is almost Schreier under the assumption that  $R$  is a subset of  $R$  is a root extension We then specialize to the case of commutative semigroup rings and show that if  $R$   $M$  is a subset of Special characters omitted is a root extension then  $R$   $M$  is almost Schreier if and only if  $R$  is an almost Schreier domain and  $M$  is an almost Schreier monoid

*A Study of Unique Factorization in Quadratic Integral Domains* Ronald Lee Van Enkevort,1967 This thesis studies the question of unique factorization in quadratic integral domains In the first chapter many general theorems and definitions from algebraic number theory are introduced The second chapter considers an integral domain in which unique factorization holds The necessary theorems to prove unique factorization are developed The third chapter concerns an integral domain in which unique factorization fails That it fails is proved and then ideals are introduced to indicate how unique factorization would be restored in terms of ideals

*Rings, Monoids and Module Theory* Ayman Badawi,Jim Coykendall,2022-03-11 This book contains select papers on rings monoids and module theory which are presented at the 3rd International Conference on Mathematics and Statistics AUS ICMS 2020 held at the American University of Sharjah United Arab Emirates from 6 9 February 2020 This conference was held in honour of the work of the distinguished algebraist Daniel D Anderson Many participants and colleagues from around the world felt it appropriate to acknowledge his broad and sweeping contributions to research in algebra by writing an edited volume in his honor The topics covered are inevitably a cross section of the vast expansion of modern algebra The book is divided into two sections surveys and recent research developments with each section hopefully offering symbiotic utility to the reader The book contains a balanced mix of survey papers which will enable expert and non expert alike to get a good overview of developments across a range of areas of algebra The book is expected to be of interest to both beginning graduate students and experienced researchers

*Analytic Partial Differential Equations* François Trèves,2022-04-26 This book provides a coherent self contained introduction to central topics of Analytic Partial Differential Equations in the natural geometric setting The main themes are the analysis in phase space of analytic PDEs and the Fourier Bros Iagolnitzer FBI transform of distributions and hyperfunctions with application to existence and regularity questions The book begins by

establishing the fundamental properties of analytic partial differential equations starting with the Cauchy Kovalevskaya theorem before presenting an integrated overview of the approach to hyperfunctions via analytic functionals first in Euclidean space and once the geometric background has been laid out on analytic manifolds Further topics include the proof of the Lojaciwicz inequality and the division of distributions by analytic functions a detailed description of the Frobenius and Nagano foliations and the Hamilton Jacobi solutions of involutive systems of eikonal equations The reader then enters the realm of microlocal analysis through pseudodifferential calculus introduced at a basic level followed by Fourier integral operators including those with complex phase functions la Sj strand This culminates in an in depth discussion of the existence and regularity of distribution or hyperfunction solutions of analytic differential and later pseudodifferential equations of principal type exemplifying the usefulness of all the concepts and tools previously introduced The final three chapters touch on the possible extension of the results to systems of over or under determined systems of these equations a cornucopia of open problems This book provides a unified presentation of a wealth of material that was previously restricted to research articles In contrast to existing monographs the approach of the book is analytic rather than algebraic and tools such as sheaf cohomology stratification theory of analytic varieties and symplectic geometry are used sparingly and introduced as required The first half of the book is mainly pedagogical in intent accessible to advanced graduate students and postdocs while the second more specialized part is intended as a reference for researchers
