**Recursion-Theoretic Hierarchies** Peter G. Hinman, 2017-03-02 Since their inception the Perspectives in Logic and Lecture Notes in Logic series have published seminal works by leading logicians Many of the original books in the series have been unavailable for years but they are now in print once again The theory set out in this volume the ninth publication in the Perspectives in Logic series is the result of the meeting and common development of two currents of mathematical research descriptive set theory and recursion theory Both are concerned with notions of definability and with the classification of mathematical objects according to their complexity These are the common themes which run through the topics discussed here The author develops a general theory from which the results of both areas can be derived making these common threads clear

**Reflections on the Foundations of Mathematics: Essays in Honor of Solomon Feferman** Wilfried Sieg, Richard Sommer, Carolyn Talcott, 2002-08-16 Solomon Feferman has shaped the field of foundational research for nearly half a century These papers most of which were presented at the symposium honoring him at his 70th birthday reflect his broad interests as well as his approach to foundational research which places the solution of mathematical and philosophical problems at the top of his

*Logic and Structure* Dirk van Dalen, 2013-11-11 Logic appears in a sacred and in a profane form The sacred form is dominant in proof theory the profane form in model theory The phenomenon is not unfamiliar one observes this dichotomy also in other areas e g set theory and recursion theory For one reason or another such as the discovery of the set theoretical paradoxes Cantor Russell or the definability paradoxes Richard Berry a subject is treated for some time with the utmost awe and diffidence As a rule however sooner or later people start to treat the matter in a more free and easy way Being raised in the sacred tradition I was greatly surprised and some what shocked when I observed Hartley Rogers teaching recursion theory to mathematicians as if it were just an ordinary course in say linear algebra or algebraic topology In the course of time I have come to accept his viewpoint as the didactically sound one before going into esoteric niceties one should develop a certain feeling for the subject and obtain a reasonable amount of plain working knowledge For this reason I have adopted the profane attitude in this introductory text reserving the more sacred approach for advanced courses Readers who want to know more about the latter aspect of logic are referred to the immortal texts of Hilbert Bernays or Kleene

**The Mathematical Intelligencer**, 1984

**Science and Computers** Gian-Carlo Rota, 1986 Nicholas Metropolis is best known for his contributions to the Monte Carlo method including the algorithm for computerization of the calculations for some

integro differential equations and the development of the digital computer The papers in this volume may be on related subjects subjects wherein Metropolis s work served as inspiration and as extensions of subject matter Metropolis explored

**Methodologies for Intelligent Systems, 4** Zbigniew Raś,1989 Elektronische Informationsverarbeitung und Kybernetik, 1981 *Mathematical Centre Tracts*, 1982 **ISILC - Logic Conference** G. H. Müller,A. Oberschelp,K. Potthoff,1975-12 *Computability in Combinatory Spaces* Dimitür Genchev Skordev,1992 This volume provides an account of the current state of the theory of combinatory spaces and discusses various applications Here the term combinatory space can be regarded as a system for functional programming and bears no close connection with combinatory logic

**Mathematical Foundations of Computer Science**, 1992 *Notices of the American Mathematical Society* American Mathematical Society,1983 Contains articles of significant interest to mathematicians including reports on current mathematical research *Preprint Series* Universitetet i Oslo. Matematisk institutt,1978 *Handbook of Philosophical Logic* Dov M. Gabbay,Franz Guentner,1983-10-31 The aim of the first volume of the present Handbook of Philosophical Logic is essentially two fold First of all the chapters in this volume should provide a concise overview of the main parts of classical logic Second these chapters are intended to present all the relevant background material necessary for the understanding of the contributions which are to follow in the next three volumes We have thought it to be of importance that the connections between classical logic and its extensions covered in Volume 11 as well as its most important alternatives covered in Volume III be brought out clearly from the start The first chapter presents a clear and detailed picture of the range of what is generally taken to be the standard logical framework namely predicate or first order quantificational logic On the one hand this chapter surveys both propositional logic and first order predicate logic and on the other hand presents the main metalogical results obtained for them Chapter 1 1 also contains a discussion of the limits of first order logic i e it presents an answer to the question Why has predicate logic played such a formidable role in the formalization of mathematics and in the many areas of philo sophical and linguistic applications Chapter 1 1 is prerequisite for just about all the other chapters in the entire Handbook while the other chapters in Volume I provide more detailed discussions of material developed or hinted at in the first chapter *The Essence of Rum: a Theory of the Intensional and Extensional Aspects of Lisp-type Computation* Carolyn L. Talcott,Stanford University. Computer Science Department,1985 Rum is a theory of applicative side effect free computations over an algebraic data structure It goes beyond a theory of functions computed by programs treating both intensional and extensional aspects of computation Powerful programming tools such as streams object oriented programming escape mechanisms and co routines can be represented Intensional properties include the number of multiplications executed the number of context switches and the maximum stack depth required in a computation Extensional properties include notions of equality for streams and co routines and characterization of functionals implementing strategies for searching tree structured spaces Precise definitions of informal concepts such as stream and co

routine are given and their mathematical theory is developed Operations on programs treated include program transformations which introduce functional and control abstractions a compiling morphism that provides a representation of control abstractions as functional abstractions and operations that transform intensional properties to extensional properties The goal is not only to account for programming practice in Lisp but also to improve practice by providing mathematical tools for developing programs and building programming systems Rum views computation as a process of generating computation structures trees for context independent computations and sequences for context dependent computations The recursion theorem gives a fixed point function that computes computationally minimal fixed points The context insensitivity theorem says that context dependent computations are uniformly parameterized by the calling context and that computations in which context dependence is localized can be treated like context independent computations
