

Reading Comprehension

Latitude and Longitude

Latitude and longitude are two coordinates that are used to describe the location of a place on the Earth's surface. Latitude is a measure of how far north or south a place is, while longitude is a measure of how far east or west it is.

Latitude is measured in degrees, with the equator being at 0 degrees. Places to the north of the equator are given a positive latitude, while places to the south are given a negative latitude. For example, New York City has a latitude of 40 degrees north, while Sydney, Australia has a latitude of 33 degrees south.

Longitude is also measured in degrees, with the prime meridian (which runs through Greenwich, England) being at 0 degrees. Places to the east of the prime meridian are given a positive longitude, while places to the west are given a negative longitude. For example, London, England has a longitude of 0 degrees, while Los Angeles, California has a longitude of 118 degrees west.

Latitude and longitude are used in a variety of fields, including geography, navigation, and meteorology. They are used to plot locations on maps and to track the movement of storms and other weather patterns.

One of the main advantages of using latitude and longitude is that they provide a standardized system for describing location that is used all over the world. This makes it easier to communicate and compare locations, regardless of where they are.
