Matsuda, E. Papastavros, E. Pfaunmiller, M. Sobansky, X. Zheng, 2013-01-08 Affinity chromatography is a type of liquid chromatography that uses a biologically related agent as a stationary phase to purify or analyze specific sample components. This chapter examines the basic components and principles of affinity chromatography and various applications of this method. The general types of ligands, immobilization schemes, support materials, and elution conditions that can be employed in affinity chromatography are first examined. Various methods in this field are then considered, including bioaffinity chromatography, immunoaffinity chromatography, dye ligand and biomimetic affinity chromatography, immobilized metal ion affinity chromatography, and analytical affinity chromatography. The types of ligands utilized in each of these methods are described along with common applications of these techniques. Several related developments are also discussed, such as the use of affinity chromatography with mass spectrometry, miniaturized systems, molecularly imprinted polymers, and aptamers.

Enzymes Biotechnology Handbook NIIR Board of Consultants & Engineers, 2004-01-01 Industrial biotechnology is the practice of using cells to generate industrially useful products. An enzyme is a protein that catalyzes or speeds up a chemical reaction. Enzymes are the focal point of biotechnological processes; without them, biotechnology as a subject would not exist. The main advantage of enzymes compared to most other catalysts is their stereo region and chemo selectivity and specificity. Enzymes are responsible for many essential biochemical reactions in micro organisms, plants, animals, and human beings. Biotechnology processes may have potential in energy production, specifically in the substitution of renewable plant biomass for fossil feedstock. This will depend on the development of enzymes able to degrade cellulose in plant biomass and designing methods to recycle or dispose of spent biomass. With time, research and improved protein engineering methods, many enzymes have been genetically modified to be more effective at the desired temperatures, pH, or under other manufacturing conditions, typically inhibitory to enzyme activity, e.g. harsh chemicals, making them more suitable and efficient for industrial or home applications. Enzymes are used in the extraction of natural products as catalysts in organic chemistry, in clinical analysis, in industrial processes, and so on. The application of enzymes is found in many different fields, and it is one of the good sectors to venture. In coming few years, it is estimated that world enzyme demand will average annual increases of 6-3 percent. This book basically deals with principles of industrial enzymology, basis of utilization of soluble and immobilized enzymes in industrial processes, principles of immobilization of enzymes, enzymes in clinical analysis, principles, practical aspects of large scale protein purification, the applications of enzymes in industry, use of enzymes in the extraction of natural products, data on techniques of enzyme immobilization and bio affinity procedures, etc. In this book, you can find all the basic information required on the fundamental aspects of the enzymes, their chemistry, bio chemistry, as well as detailed information of their applications, a wide variety of industrial processes, etc. The book is very useful for research scholars, technocrats, institutional libraries, and entrepreneurs who want to enter into the field of manufacturing of enzymes.
