Paselk, 1963 Providing optimum systems for any aerospace vehicle confronts all system engineers Better methods for arriving at system selection rapidly and economically with a greater confidence of operational suitability are greatly needed As such problems associated with the synthesis of optimal environmental control systems were explored and preliminary methods were developed and applied to an atmospheric control circuit Supporting analytical studies were made of heat and mass transfer and chemical processes as a basis for development of synthesis and optimization technology Emphasis was placed on improving systems design and selection

capability during vehical preliminary design system and subsystem design Process description and transformation to characteristics which show direct influence of requirements vehical data system variables process selection and reliability were invwestigated for some atmospheric control circuits Further investigations are currently being pursued to continue the systhesis of optimal environmental control systems for aerospace vehicles started in this study
