HC 739 - Linking Emissions Trading Systems Great Britain. Parliament. House of Commons. Energy and Climate Change Committee,2015 Carbon pricing is a necessary element in spurring climate change mitigation action In this report it s argued that emissions trading as an established and well recognised policy instrument for controlling greenhouse gas emissions is increasingly popular and spreading around the world As they develop emissions trading systems should be designed so that they are compatible with each other Aligning design elements early on will help improve the prospects of linking different systems in future and therefore maximise opportunities for cost effective emissions reductions As the world s oldest and largest market the EU Emission Trading System will play a critical role in facilitating linking between different markets Before it can do this however it must be seen as a credible market The issue of surplus allowances must be addressed urgently and there should be moves to remove these from the system as soon as possible Any new climate agreement must crucially allow parties to meet their Intended Nationally Determined Contribution s INDCs by transferring parts of their contributions to other parties and financing emissions reduction activities in other countries The use of carbon markets will greatly improve the prospects of keeping global average temperatures below 2 C Any agreement reached at the UNFCCC COP 21 in Paris at the end of 2015 should promote the use of carbon markets and facilitate the future linking of emissions trading systems The UNFCCC could also play a critical role in providing basic standards including monitoring reporting and verification

Using Emissions Trading to Combat Climate Change David Harrison,Per Klevnas,Albert L. Nichols,Daniel Radov,2008 Emissions trading has emerged as the major policy approach for addressing climate change as evidenced by programs and proposals in the Australia Europe the United States and elsewhere A host of choices need to be made to design and implement a greenhouse gas emissions trading program choices that are important both to the performance of the program and to the many private firms and groups that are affected This article provides an overview of the major programs and proposals and summarizes the key design choices that governments will be making We note that private firms and sectors need to understand how their costs and revenues might be affected by greenhouse gas cap and trade programs including differences depending upon various policy alternatives and to determine how to take advantage of the flexibility provided by emissions trading The development of a carbon market as well as the other market effects of a climate change

program also will affect key decisions such as the development of new capacity or the retirement of existing plants and equipment Understanding these influences will help firms and sectors to respond effectively and in the process allow the trading programs to achieve the goal of meeting key climate change objectives at lowest cost to society

Environmental Commodities Markets and Emissions Trading Blas Luis Pérez Henríquez,2013 Market based solutions to environmental problems offer great promise but require complex public policies that take into account the many institutional factors necessary for the market to work and that guard against the social forces that can derail good public policies Using insights about markets from the new institutional economics this book sheds light on the institutional history of the emissions trading concept as it has evolved across different contexts It makes accessible the policy design and practical implementation aspects of a key tool for fighting climate change emissions trading systems ETS for environmental control Blas Luis P rez Henr quez analyzes past market based environmental programs to extract lessons for the future of ETS He follows the development of the emissions trading concept as it evolved in the United States and was later applied in the multinational European Emissions Trading System and in sub national programs in the United States such as the Regional Greenhouse Gas Initiative RGGI and California s ETS This ex post evaluation of an ETS as it evolves in real time in the real world provides a valuable supplement to what is already known from theoretical arguments and simulation studies about the advantages and disadvantages of the market strategy Political cycles and political debate over the use of markets for environmental control make any form of climate policy extremely contentious P rez Henr quez argues that despite ideological disagreements the ETS approach or more popularly cap and trade policy design remains the best hope for a cost effective policy to reduce GHG emissions around the world
