and conversion it is first necessary to ascertain how to save energy and to refurbish energy conversion systems to obtain the highest efficiencies with the lowest CO₂ emissions e g in large scale electricity generation Collected here in 7 chapters are the contributions of internationally known electrochemical engineers who work actively in this rapidly developing field The relevant work reviewed extends from fundamental findings in the field of technical electrocatalysis of hydrogen and oxygen reactions to water electrolysis chlor alkali electrolysis which is still practically the most important process for electrolytic hydrogen generation thermochemical hybrid cycles and on finally to fuel cells The latter in their advanced form of heavy high temperature cells promise to become the basis for highly efficient electric power plants for converting the chemical energy of fossil fuels or hydrogen from fossil combustibles like methane or coal into electricity with system efficiencies greater than 55% The material presented in this volume should prove of immense value to electrochemical engineers producers of electrolyzers and fuel cells electrical engineers and political technical decision makers It will also be of use to academic teachers lecturing on electrochemistry and advanced technologies
