processing techniques needed to analyze experimental clinical and other numerical data It provides a small vocabulary of essential computer statements and shows how they are used to solve problems in the biological physical and medical sciences No mathematical background beyond algebra and an inkling of the principles of calculus is assumed All more advanced mathematical techniques are developed from scratch before they are used The computing language is BASIC a high level language that is easy to learn and widely available using time sharing computer systems and personal microcomputers The strategy of the book is to present computer programming at the outset and to use it throughout BASIC is developed in a way reminiscent of graded readers used in human languages the first programs are so simple that they can be read almost without an introduction to the language Each program thereafter contains new vocabulary and one or more concepts explained in the text not used in the previous ones By gradual stages the reader can progress from programs that do nothing more than count from one to ten to sophisticated programs for nonlinear curve fitting matrix algebra and multiple regression There are 33 working programs and except for the introductory ones each performs a useful function in everyday data processing problems encountered by the experimentalist in many diverse fields
