

1) Psychology as a science and its philosophies and theories of science

Psychology's struggle with its status as a scientific discipline

Scientism
Naturalism
Reductionist approaches
Higher-order complexity, contextuality, developmental and socio-cultural constitution of human experience ignored

Jingle-jangle fallacies

Entification, reification - treating abstract terms as if they were real things

Intricacies of human language (e.g., inbuilt semantics) overlooked

Nominalism – methods in name only

Nomothetic networks solely based on semantic networks

Psychologists' cardinal error: Confusing ontological with epistemological concepts

Turning description of study phenomena into their explanation

Misinterpret raters' judgements of verbal statements as measurements of the phenomena described in those statements

2) Specific theories, epistemologies and methodologies of genuine analogues of measurement

Conceptualisation of real (empirical) study system neglected

Operationalist generation of quantitative data with rating 'scales'

Statistics is not measurement (different epistemic purposes)

Replicability: comparing results with each other rather than with a theory

Focus on data analysis, neglecting data generation

Operationalist definition of 'measurement' as "assignment of numerals to objects according to a rule"

Connections of phenomenal object domain to numerical models and known quantity standards neither conceptualised nor established

Arbitrary units'

Psychometric 'scales' used as both 'instrument' and model

Quantitative imperative

Aggregationist statistics

Myth of unit-free 'measurement'

Inherent limitations for genuine measurement

Result-dependent 'instrument' design and data modelling

Axioms of quantity unmet

Soft, weak or wide definition of measurement

Psychology's Questionable Research Fundamentals (QRFs)

Relying only on inbuilt semantics of human language, ignoring the data's empirical semantics

Mistaking descriptions of study phenomena for the phenomena described

Language-based research locked in mutually defining semantic networks

Operational construct definitions mistaken for theoretical definitions

Nomotheticism - Nomothetic approaches misunderstood as implying solely sample-level analyses, ignoring case-by-case based nomothetic approaches

Ignoring complex relations (one-to-many, many-to-one)

Variable-oriented (rather than individual/person-oriented) analyses

Latent variables misinterpreted as 'traits' or 'psychophysical mechanisms'

Sample-level statistics for studying individual-level phenomena

Failacies in sample-to-individual inferences

Sample averages instead of individual configurations

Mathematical-statistical ergodic theory not considered

Non-ergodicity of psychology's study phenomena ignored

Psycho-demography

Theoretical and empirical units of analysis shifting between sample and individual

3) Psychology's means of scientific inquiry

4) Strategies for generalising across unique individuals
