Further Developments in Turbulence Management K. Krishna Prasad,1993 **Further Developments in Turbulence Management** K Krishna Prasad,2014-01-15 **Advances in Structural Optimization** J. Herskovits,2012-12-06 Advances in Structural Optimization presents the techniques for a wide set of applications ranging from the problems of size and shape optimization historically the first to be studied to topology and material optimization Structural models are considered that use both discrete and finite elements Structural materials can be classical or new Emerging methods are also addressed such as automatic differentiation intelligent structures optimization integration of structural optimization in concurrent engineering environments and multidisciplinary optimization For researchers and designers in industries such as aerospace automotive mechanical civil nuclear naval and offshore A reference book for advanced undergraduate or graduate courses on structural optimization and optimum design *Recent Advances in DNS and LES* Doyle Knight,Leonidas Sakell,2012-12-06 Rapid advances in Direct Numerical Simulation DNS and Large Eddy Simulation LES of turbulence provide opportunities for improved prediction of incompressible and compressible turbulent flows The book includes five invited and thirty eight contributed papers presented at the Second AFOSR International Conference on DNS and LES held at Rutgers The State University of New Jersey on June 7 9 1999 A broad range of topics in DNS and LES are presented including new developments in LES modeling numerical algorithms for LES and DNS DNS and LES of reacting flows and DNS and LES for supersonic and hypersonic boundary layers The book provides a extensive view of the state of the art in DNS and LES *IUTAM Symposium on Advances in Mathematical Modelling of Atmosphere and Ocean Dynamics* P.F. Hodnett,2012-12-06 The goals ofthe Symposium were to highlight advances in modelling ofatmosphere and ocean dynamics to provide a forum where atmosphere and ocean scientists could present their latest research results and learn ofprogress and promising ideas in these allied disciplines to facilitate interaction between theory and applications in atmosphere ocean dynamics These goals were seen to be especially important in view ofcurrent efforts to model climate requiring models which include interaction between atmosphere ocean and land influences Participants were delighted with the diversity ofthe scientific programme the opportunity to meet fellow scientists from the other discipline either atmosphere or ocean with whom they do not normally interact through their own discipline the opportunity to meet scientists from many countries other than their own the opportunity to hear significant presentations 50 minutes from the keynote speakers on a range ofrelevant topics Certainly the goal ofcreating a forum for exchange between atmosphere and ocean scientists who need to input to create realistic models for climate prediction was achieved by the Symposium and this goal will hopefully be further advanced by the publication ofthese Proceedings **Control of Flow Instabilities and Unsteady Flows** G.E.A. Meier,G.H. Schnerr,2014-05-04 This volume contributes to one of the most important topics of Fluid Mechanics in future and presents recent research results on control theory and applied control methods Understanding and handling of control

methods of nonlinear systems typical of Fluid Mechanics is the key to reduce losses and to improve the efficiency and safety of technical processes Advances in the Mechanics of Plates and Shells D. Durban, Dan Givoli, J.G. Simmonds, 2006-04-11

The optimal control of flexible structures is an active area of research The main body of work in this area is concerned with the control of time dependent displacements and stresses and assumes linear elastic conditions namely linear elastic material behavior and small deformation See e.g. 1-3 the collections of papers 4-5 and references therein On the other hand in the present paper we consider the static optimal control of a structure made of a nonlinear elastic material and undergoing large deformation An important application is the suppression of static or quasi static elastic deformation in flexible space structures such as parts of satellites by the use of control loads 6 Solar radiation and radiation from other sources induce a temperature field in the structure which in turn generates an elastic displacement field The displacements must usually satisfy certain limitations dictated by the allowed working conditions of various orientation sensitive instruments and antennas in the space vehicle For example a parabolic reflector may cease to be effective when undergoing large deflection The elastic deformation can be reduced by use of control loads which may be implemented via mechanically based actuators or more modern piezoelectric devices When the structure under consideration is made of a rubber like material and is undergoing large deformation nonlinear material and geometric effects must be taken into account in the analysis

Vibration Control of Active Structures A. Preumont, 2012-12-06 I was introduced to structural control by Raphael Haftka and Bill Hallauer during a one year stay at the Aerospace and Ocean Engineering department of Virginia Tech during the academic year 1985-1986 At that time there was a tremendous interest in large space structures in the USA mainly because of the Strategic Defense Initiative and the space station program Most of the work was theoretical or numerical but Bill Hallauer was one of the few experimentalists trying to implement control systems which worked on actual structures When I returned to Belgium I was appointed at the chair of Mechanical Engineering and Robotics at ULB and I decided to start some basic vibration control experiments on my own A little later smart materials became widely available and offered completely new possibilities particularly for precision structures but also brought new difficulties due to the strong coupling in their constitutive equations which requires a complete reformulation of the classical modelling techniques such as finite elements We started in this new field with the support of the national and regional governments the European Space Agency and some bilateral collaborations with European aerospace companies Our Active Structures Laboratory was inaugurated in October 1995 IUTAM Symposium on Interaction Between Dynamics and Control in Advanced Mechanical Systems Dick H. van Campen, 1997-03-31 The proceedings of the April 1996 symposium address a wide variety of applications ranging from vehicle systems to mechatronic systems Further they illuminate the relevancy of more fundamental areas such as control of chaos and optimal control The 51 contributions promote theoretical and applied investigations with respect to the interaction of dynamics and control in advanced engineering applications Additional topics include motion control dynamics and

bifurcation of nonlinear systems modelling and dynamics of engineering systems vibration control adaptive control optimization and control mechatronic systems modelling control of engineering systems system identification and analysis and control of nonlinear systems Papers are arranged alphabetically by the first author's last name and there is an author index only no subject index Annotation copyrighted by Book News Inc Portland OR

Recent Developments in Turbulence Management K.-S. Choi, 2012-12-06 The European Drag Reduction Meeting has been held on 15th and 16th November 1990 in London This was the fifth of the annual European meetings on drag reduction in engineering flows The main objective of this meeting was to discuss up to date results of drag reduction research carried out in Europe The organiser has adopted the philosophy of discussing the yesterday's results rather than the last year's results No written material has therefore been requested for the meeting It was only after the meeting the submission of papers was requested to the participants from which 16 papers were selected for this proceedings volume The meeting has attracted a record number of participants with a total of 52 researchers from seven European countries U K France Germany the Netherlands Italy Switzerland and U S S R as well as from Japan Canada and Australia The subjects covered in this proceedings volume include riblets LEBUs Large Eddy Break Up device surface roughness compliant surfaces and polymer additives Riblets seem to be one of the most extensively studied devices in the past years Reflecting this situation in the European community there are six papers on riblets covering their practical applications to aircraft and to a model ship near wall coherent structure of the boundary layer and effects of flow three dimensionality Possibility of heat transfer enhancement with riblets and potential use in the laminar flow are also investigated An analytical model is developed for the boundary layer with a LEBU device

International Aerospace Abstracts, 1999 IUTAM Symposium on Asymptotic Methods for Turbulent Shear Flows at High Reynolds Numbers K. Gersten, 1996-07-31 This volume contains the contributions presented at the IUTAM Symposium on Asymptotic Methods for Turbulent Shear Flows which was the first international conference on the subject The book provides an overview of the state of the art in this field and presents results found worldwide Asymptotic theory is here considered as the application of perturbation methods singular perturbation methods multiscale methods rapid distortion theory etc to solving the Reynolds averaged flow equations for turbulent shear flows at high Reynolds numbers These methods play an important role in turbulence modelling as is demonstrated by many examples including turbulence models describing flow separation It becomes evident that asymptotic methods enable the extraction of a fairly comprehensive set of results from the governing equations without incorporating a specific turbulence model a priori Furthermore these methods can be used to quickly eliminate unsatisfactory models The book contains valuable results for turbulence researchers in particular for those working in turbulence modelling Eddy Structure Identification in Free Turbulent Shear Flows J.P. Bonnet, M.N. Glauser, 1993-09-30 The existence and crucial role played by large scale organized motions in turbulent flows are now recognized by industrial applied and fundamental researchers alike It has become increasingly evident that coherent

structures influence mixing noise vibration heat transfer drag etc The acceleration of the development of both experimental and computational programs devoted to this topic has been evident at several recent international meetings One of the first questions which experimentalists or numerical analysts are faced with is how can these structures be separated from the background turbulence This is a nontrivial task because the coherent structures are generally embedded in a random field and the technique used to determine when and where certain structures are passing or their averaged characteristics in the more probable or dominant role sense is directly related to the definition of the coherent structure Several methods or approaches are available and the choice of a particular one is generally dependent on the desired information This choice depends not only on the definition of the structure but also on the experimental and numerical capabilities available to the researcher
