ABSTRACT

The main purpose of this paper is to experimentally explore the effects of grain shape and size on the mechanical behavior of compacted earthen materials. Sand-earth, natural rounded gravel and crushed angular gravel are the three materials used in this study. Both gravels are from the same site and characterized by the same grain size curve. The uniaxial compression tests, the results of which are presented and discussed in this paper, were performed on cylindrical specimens of three materials: sand-earth mixture, rounded gravel-earth mixture and angular gravel-earth mixture. The tested specimens were prepared under optimum compaction references, using the Proctor test procedures. For each compression test, four parameters are determined: the compressive strength, the initial tangent modulus, the secant modulus at maximum stress and the peak axial strain corresponding to the maximum compressive stress. The results obtained show that the mechanical behavior of gravel-earth mixture may be influenced by grain shape of the gravel used, thus introducing a new parameter to be taken into account when preparing unstabilized rammed earth material. Further experimental studies are recommended to better assess these results.

1. Introduction

Compacted earth is an ancestral building material. The most common method employed to use this material is called rammed earth, which may or may not be stabilized using additives such as cement, lime, natural fibers, etc. Over the past few decades, studies have shown that physical and mechanical characteristics of compacted earth depends on many parameters including water content [1–3], compaction method and energy [4], clay content [5], grain size distribution, etc. As for grain size distribution, optimal granular spindles have been recommended for the rammed earth method in order to obtain the most suitable material without adding stabilizers (i.e. unstabilized rammed earth). The most well-known spindle seems to be the one established by Houben and Guillaud [6]. These grain size spindles are included in Standards used in some countries such the Australian code HB 195 [7]. Others spindles can be found in a review on rammed earth by Maniatis and Walker [8].

The curves, describing these grain size spindles and recommended by these engineering references, are based, as explained in a recent article by Koutous and Hilali [9], on the following Fuller-Thompson formula [10]:

$$P(X) = 100 \left(\frac{d}{D} \right)^n \quad (1)$$
