

ENVIRONMENTAL IMPACT OF METAL MINING ON CATCHMENT DRAINAGE IN THE HISTORIC MINING AREA OF RECSK-LAHÓCA MINES, HUNGARY

Jordan G.^(1,2), Rukezo G.⁽³⁾, Fűgedi U.⁽³⁾, Carranza E.J.M.⁽⁴⁾, Somody A.⁽⁵⁾, Vekerdy Z.⁽⁵⁾, Szabényi G.⁽⁵⁾ and Lois L.⁽⁵⁾

KEY WORDS: *catchment, drainage geochemistry, environmental impact, heavy metals, mining.*

INTRODUCTION

The mining of volcanogenic sulphide ore deposits in the Recsk-Lahóca mines in the Mátra Mountains of Hungary resulted in the exposure of sulphide bearing rocks to surface water and atmospheric oxygen, which accelerate oxidation, leaching and release of metals and acidity. Tailings, mine adits and associated waste rock dumps resulting from the two-century Cu, Au and Ag mining are scattered along the streams in the catchment area (Fig. 1). Environmental problems arise from Acid

Mine Drainage (AMD) discharge into the drainage system, which results in metal pollution and acidification of the aquatic environment within the vicinity of the mine areas. Elevated metal content in both surface waters and sediments were reported by earlier studies.

The objective of the study was to identify and assess the impacts of AMD on the receiving stream waters and sediments. Specific objectives were to (1) identify and map metal contamination due to sulphide ore deposit mining, (2) use spatial variability to determine sources of heavy metal contamination in the studied catchment, (3) distinguish natural background contributions from mine pollution, and (4) create a geochemical risk map of catchment drainage.

Figure 1 - Study area. Main mine features and sample locations.
