**ABSTRACT:** The history and evolutionary pathways of defense reactions among various forms of life are reconstructed. The vertebrates evolved step-by-step from their invertebrate ancestors living in the distant past. The ancestry of vertebrate defense mechanisms must be traceable to them because these functions cannot be considered separately from the common evolutionary schema. The first part of this survey is therefore devoted to the description of major defense reactions and achievements in invertebrates. Particular emphasis is given to the taxa of present-day invertebrates most likely to exhibit some relationship to the chordates and thus to show real traces of vertebrate immune patterns. The second part involves three key assemblages of deuterostomate animals — the echinoderms, the nonvertebrate chordates, and the first vertebrates because these animals are believed to have created the prerequisites for transition from the invertebrate type of defense to the vertebrate type of adaptive immunity.

**KEY WORDS:** evolution, phylogenesis, invertebrates, vertebrates, immunity, defense reactions.

## I. INTRODUCTION

Understanding the ancestry of intraorganismic defense, i.e., the evolution of immunity and its hierarchical organization, is not merely an academic exercise. It is important to make clear the fundamental immunological mechanisms and functional processes as well. It seems probable that few, if any, immune structures and organs initially developed their present highly sophisticated hierarchy precisely for the reactions of defense they now serve. The present type of adaptive immunity, which we meet in its highest form only in endothermic vertebrates, is probably the result of functional integration and anatomical specialization of body structures and organs (Figure 1). At the same time, the emergence of new structures that have accompanied the changing body plans of protochordates, chordates, and ul-

timately vertebrates has played a role as well. In brief, the predispositions and constraints of the genome have or have not influenced the changes in the morphofunctional outfit of an organism inherited from the past. They also have modulated the ability of an individual to survive, to react to changing conditions by adaptation, and to radiate into the new environment. The universal tendency to be better adapted than the previous generations has been a propeller of a better structurally and functionally hierarchized immune system. Understanding evolutionary strategies of the presently living descendants of such animals as protochordates, chordates, and less advanced vertebrates could lead to a deeper comprehension of the fundamental organizing principles shared commonly by all features of adaptive immunity.

In all living creatures today, the defense mechanisms have evolved into an effective device that

*Evolution of Immune Reactions* Petr Sima, Vaclav Vetvicka, 1990-08-27 This book on phylogeny and immunity reconstructs the history and evolutionary pathways of immunity among the various forms of life The authors argue that the immunity could have evolved different adequately successful patterns in the animal sub regnum which are strictly determined by the morpho physiological possibilities of the animals They state that the vertebrate type of immunity evolved only in the chordate branch The publication devotes special attention to the arthropods and molluscs as they have attracted more investigative efforts than any other invertebrate taxa The authors selected Agnatha Chondrichthyes and Osteichthyes from the vertebrate taxa in order to show where and how the morphofunctional basis of the truly adaptive immunity of the endothermic tetrapods gradually evolved Each chapter gives the description of the origin and interrelationships of the representatives of the taxon in question Also given are the main biological morphological non morphological and immune attributes Emphasized throughout the book is the central idea that immunological reactions are a part of the overall biological phenomena and should be studied only from this aspect The authors express that the fields of comparative and evolutionary immunology will provide inspiration for further investigations in biomedicine in the near future

Velleman,Gale M. Strasburg,2025-05-15 Over the past several decades the poultry industry has achieved huge improvements in global poultry production including with increased growth performance improved body composition higher market weight increased feed efficiency reduced production costs and increased profitability for growers These gains have resulted from a combination of intensive genetic selection tailored nutritional approaches and novel poultry management strategies However these improvements in broiler chicken and turkey production have also come with costs These costs include increased susceptibility to environmental stress increased mortality in commercial poultry flocks and muscle pathogenesis ultimately leading to deleterious effects on meat quality traits affecting appearance texture and protein functionality For example a subset of fast growing domestic turkeys develops spontaneous cardiomyopathy or round heart disease that leads to a

mortality rate up to 15% at 2 to 4 weeks of age Even turkeys that survive the critical first two weeks after hatch already have damaged hearts at a prevalence of 80% to 90% which may lead to growth retardation during the grow out phase This syndrome can also occur in broiler chickens which causes major economic losses and limits the maximum profitability in the poultry industry world wide Another example is wooden breast an abnormal muscle condition resulting in a hardening of the breast muscle affecting meat texture Other examples include green muscle disease also known as deep pectoral muscle myopathy spaghetti meat and white striping All of these pathologies include the development of myopathic changes subsequently affecting meat quality leading to consumer complaints and economic losses by the processing industry There is a paucity of information on the etiologies of broiler and turkey muscle pathogenesis and their consequent effects on muscle physiology This Research Topic will highlight the mechanisms of skeletal and cardiac muscle pathogenesis in poultry that are responsible for premature bird mortality and altered quality of muscle as a food This research topic will cover the recent findings in the area of myopathies in poultry Original Research and Review papers among other article types are welcome to be submitted to this collection
