Global Ecodynamics:

Natural Disasters as Interactive Components of Global-Ecodynamics Kirill Ya Kondratyev, Vladimir F. Krapivin, Costas A. Varostos, 2006-08-31 Large scale natural catastrophes are environmental phenomena Numerous studies in recent years have concluded that the frequency of occurrence of such natural disasters have been increasing leading to an enhanced risk of very considerable human and economic losses and the widespread destruction and pollution of habitats settlements and infrastructure In 2001 over 650 natural disasters happened around the globe with economic losses exceeding 35 billion 2004 ended with the South East Asian tsunami on 26th December with its huge toll on life and local economics and this demonstrated that the effects of such disasters are most keenly felt in poorer or developing regions The problem of natural disaster prediction and the implementation of environmental monitoring systems to receive store and process the information necessary for solutions of specific problems in this area have been analysed by the three authors of this book all of whom are internationally respected experts in this field

Biogeochemical Cycles in Globalization and Sustainable Development Vladimir F. Krapivin, 2008-08-21 This book opens new approach to the study of global environmental changes having unfavourable character for peoples and other living systems Main advantage of this book consists in the accumulation of knowledge from different sciences to parameterize global biogeochemical cycles in the context of globalization and sustainable development Basic global problems of the nature society system dynamics have been considered and the key problems of ensuring its sustainable development have been discussed An analysis has been made of the present trend in changing ecological systems and characteristics of the present global ecodynamics have been estimated The emphasis has been placed on the accomplishment of global geoinformation monitoring which could provide a reliable control of the environmental processes development with further obtaining prognostic estimates of consequences of realization of anthropogenic projects A new approach to the nature society system numerical modelling has been proposed and demonstrative results have been given of modelling the dynamics of this system s characteristics in cases of realization of some scenarios of anthropogenic impact on the biogeochemical cycles The importance and the need has been emphasized of development of adaptive algorithms of monitoring data processing which make it possible to reduce the economic expenses on its accomplishment and raise the reliability of the obtained estimates of the global ecodynamics characteristics Perspective approaches have been suggested for the development of technology to estimate the risk of realization of decisions on ecosystems management The realization of this approach allows integration within a complex structure of all international and national means of environmental monitoring and provides a tool for objective evaluation of the environmental quality The main purpose of this book is to develop an universal information technology to estimate the state of environmental subsystems functioning under various climatic and anthropogenic conditions and to assess the dependence of global biogeochemical cycles on the globalization processes Applied mathematicians geophysicists hydrologists socio

economists statesmen and other researchers of global change will find a wealth of information and ideas in this book

Global Ecodynamics, 2004-07 Opening with a survey of contemporary global ecodynamics including its basic components this book goes on to discuss greenhouse effect problems in the context of global carbon cycle dynamics The coverage includes land ecosystem changes air sea exchange models high latitude environmental dynamics and a discussion of basic aspects of global environmental modelling and relevant monitoring systems The volume concludes by examining society systems with emphasis on the problems of sustainable development Globalisation and Sustainable Development

Vladimir F. Krapivin, 2007-07-05 A characteristic of the present global ecological situation is increasing instability or put another way a crisis in the civilization system the global scale of which is expressed through a deterioration of human and animal habitats The most substantial features of global ecodynamics of the late 20th and early 21st centuries include the rapid increase in world population mainly in developing countries increase in the size of the urban population considerable growth in the number of megalopolises and increase in the scales of such dangerous diseases as HIV AIDS hepatitis tuberculosis etc With growing population size the problems of providing people with food and improving their living conditions in many regions will not only not be resolved but will become even more urgent Any possible benefit from decrease in per capita consumption as a result of increased efficiency of technologies will be outweighed by the impact of such a growth in population size Despite the predominant increase of population in developing countries their contribution to the impact on the environment will not necessarily exceed that of developed countries Key to ensuring sustainable development of the nature society system NSS is the relationship between production and consumption as mentioned at the World Summit on Sustainable Development in Johannesburg 2002 As civilization has developed so the problem of predicting the scale of expected climate change and associated change in human habitats has become more urgent Global Climatology and Ecodynamics

Arthur Philip Cracknell, Vladimir F. Krapivin, 2008-11-04 The exclusive role of natural ecosystems is a key factor in the maintenance of the biospheric equilibrium The current global crisis is largely caused by their dramatic decline by 43% in the past hundred years Ignoring the immutable laws and limitations which determine the existence of all living things in the biosphere could lead humanity to an ecological catastrophe This book presents the ecological demographic economic and socio psychological manifestations of the global crisis and outlines the immutable laws and limitations which determine the existence of all living things in the biosphere The authors are eminently qualified to write about the problems associated with the global crisis and consider the causes behind humanity's conflict with its environment V Danilov Danilian Associate of the Russian Academy of Sciences and Russia's former Minister of the Environment and K Losev professor at Moscow State University are leading Russian ecologists and I Reyf is a journalist who specializes in ecology and global development Dr Danilov Danilian works on the economics of nature management economic and mathematical model building sustainable development theory and ecology Dr Losev is the chief researcher and head of

the division of the VINITI All the authors have published numerous papers articles and books on such subjects as glaciology hydrology environment studies global change and sustainable development Constructive Processing of Microwave and Optical Data for Hydrogeochemical Applications Costas A. Varotsos,Vladimir F. Krapivin,Ferdenant A. Mkrtchyan,Yong Xue,2023-05-24 This book presents results of the combined use of microwave remote sensing optical tools andecoinformatics methods under solution applied tasks at both regional and global scales Ecoinformatics methods are used to assess links between global climate change and the level of ocean pollution with specific focus on the Arctic Ocean the Sea of Okhotsk and the South China Sea The theoretical and applied aspects of instrumental tools are considered in this book as a basis for the monitoring of water quality in various watersheds with particular attention to microwave remote sensing monitoring data to determine the ecotoxicological status of hydro ecosystems affected by climate change The book develops new information technologies that provide solutions for hydrochemical tasks using algorithms and models based on computer technologies for big data processing This will help to synthesize effective computer based systems for the solution of problems arising due to anthropogenic impacts on hydrological processes and objects at various spatial scales This book is intended for specialists in the fields of environmental monitoring climate change human nature interactions and geopolitics The book will be useful for undergraduate and postgraduate students studying these fields of science as well Global Ecodynamics Kirill Y Kondratyev,Vladimir F Krapivin,V P Savinykh,2004-07-01 *Social Sciences* ,2001 **Remote Sensing and Climate Change** Arthur P. Cracknell,2001-04-02 In this text international experts consider the potential value of data captured from remote sensing systems in space and covering the whole earth to yield evidence of climate change from extensive areas The role of satellites and calibration problems are considered Geophysics and space physics ,2004 Europhysics journal Environmental Disasters Kirill I A Kovlevich Kondrat'ev,Alexei A. Grigoryev,Costas Varotsos,2002-08 As the impacts of environmental disasters on populations and their economic activity increase the assessment of risk from such catastrophic events becomes more urgent not only for humankind but also for other living organisms This book details the problems caused by such environmental disasters and discusses possible mitigation methods including risk mapping using satellite monitoring data **Environmental Health** Lorraine Mooney,Roger Bate,1999 This book underlines the differences in health priorities that exist around the world and cautions against the export of inappropriate attitudes from developed to less developed countries Case studies of malaria in South Africa and cholera and Peru show the fatal consequences of allowing western preoccupations with trivial risks such as the cancer effects of pesticide residues in foods and chlorine compounds in water to influence health policy in the third world The western health paradox we are healthier yet more concerned about our health is described and the sociological factors that explain the paradox are examined We discover why people needlessly worry themselves to the point of illness Numerous examples of western health concerns are shown to be folly or hugely exaggerated Nitrates in drinking water industrial use of organic chlorine such as PVC and other plastics pesticides PCBs

Dioxin and speculation about declining sperm counts are systematically exposed Perhaps worst of all measures prompted by concerns for public safety may be making us less safe Food poisoning incidents appear to be increasing and much of the blame can be laid at the door of excessive government nannying Up to date discussion of current issues surrounding health

Topical Multidimensional Global Change Kirill I[A]kovlevich Kondrat'ev,1998-07 Multidimensional Global Change Kirill Ya Kondratyev Forty years of technological progress have had a catastrophic impact on the environment since this progress has been based on the ruthless exploitation of natural resources 20 percent of the fertile soil on cultivated land has been lost 20 per cent of tropical forests have been cleared desertification continues at a rate of 6 million hectares annually and deforestation amounts to 11 million hectares annually Economic estimations practically never take into account this depletion and damage to natural resources the harmful effect on human health the deprivation of future generations of those natural resources and the long term impact in the form of biospheric deformation In this text Kirill Kondratyev emphasises the extremely complex and interdisciplinary nature of multidimensional global change highlighting its principal aspects and many practical consequences economic social etc as well as the relationships between environmental problems on global continental and national scales He demonstrates that the main limiting factor of further quantitative development of humankind is the available biosphere resources and that the basic criterion of ecological well or ill being is the level of depletion of these resources The author highlights an acute social controversy of the modern world in that the level of biospheric resource consumption in industrially developed countries exceeds by far that in the Third World This disparity could be eliminated through advancements such as the decarbonisation of energy production and the development of new technologies However he shows that radical improvement of the situation can only be achieved by reducing the population number and establishing a new fair economic order He emphasises that when considering global change problems it is important to avoid exaggerations and he strikes a balance between the most gloomy predictions and more encouraging estimations

Meteorological and Geostrophysical Abstracts ,1995 **Our Fragile World** Mostafa Kamal Tolba,2001 *23rd European Meeting on Atmospheric Studies by Optical Methods* Vasiliy N. Ivchenko,1997 **Human Ecodynamics** Association for Environmental Archaeology. Symposium,Association for Environmental Archaeology,2000 The papers in this book were first presented at the Association for Environmental Archaeology conference at Newcastle upon Tyne in 1998 The aim of the conference was to encourage contributors to examine the inter relationships between classes of data that have increasingly come to be treated in isolation and to encourage thinking about theory in environmental archaeology Authors have focused on explicit development of theory others on bridging barriers between different fields of

study or classes of evidence The notion that people are influenced but not necessarily determined by the environments in which they live may seem like a truism but an ecodynamic perspective however requires us to question the human impact on the environment disregarding agricultural influences Human Ecodynamics discuss how people have been affecting and affected by environmental variables around them since the beginning of time Archaeologists are peculiarly well placed to link culture and nature together as the discipline discerns thriving socio cultural and biological traditions This thinking is applied to the way in which we conduct our studies of the world around us and to the boundaries between the various disciplines and sub disciplines into which we sub divide the subject matter of investigation *World Resource Review* ,2003 *Russian Journal of Ecology* ,1999 **Transactions (Doklady) of the Russian Academy of Sciences** ,1996
