Evolution And Environment:

Evolution and Environment in Tropical America Jeremy B. C. Jackson, Ann F. Budd, Anthony G. Coates, 1996-12-15
How were the tropical Americas formed This ambitious volume draws on extensive multidisciplinary research to develop new views of the geological formation of the isthmus linking North and South America and of the major environmental changes that reshaped the Neotropics to create its present day marine and terrestrial ecosystems Recent discoveries show that dramatic changes in climate and ocean circulation can occur very quickly and that ecological communities respond just as rapidly Abrupt changes in the composition of fossil assemblages formerly dismissed as artifacts of a poor fossil record now are seen as accurate records of swift changes in the composition of ocean communities The twenty four contributors use current work in paleontology geology oceanography anthropology ecology and evolution to paint this challenging portrait of rapid environmental and evolutionary change Their conclusions argue for a revision of existing interpretations of the fossil record and the processes including invading Eurasian peoples that have produced it Environmental Evolution Lynn Margulis, Clifford Matthews, Aaron Haselton, 2000 Fifteen distinguished scientists discuss the effects of life past and present on planet Earth

Evolution on Planet Earth Lynn Rothschild, Adrian Lister, 2003-06-19 Driving evolution forward the Earth's physical environment has challenged the very survival of organisms and ecosystems throughout the ages With a fresh new perspective Evolution on Planet Earth shows how these physical realities and hurdles shaped the primary phases of life on the planet The book's thorough coverage also includes chapters on more proximate factors and paleoenvironmental events that influenced the diversity of life A team of notable ecologists evolutionary biologists and paleontologists join forces to describe drifting continents extinction events and climate change important topics that continue to shape Earth's inhabitants to this very day In a world where global change has become an international issue this book provides a several billion year evolutionary perspective on what the environment and environmental change means to life Provides thorough background information on each topic while introducing cutting edge research Features original material solicited from the leading minds in evolutionary biology and geology today Emphasizes the influence of massive geological forces continental drift volcanic activity sea and tides

The Dominant Animal Paul R. Ehrlich, Anne H. Ehrlich, 2008-06-30 In humanity's more than 100 000 year history we have evolved from vulnerable creatures clawing sustenance from Earth to a sophisticated global society manipulating every inch of it In short we have become the dominant animal Why then are we creating a world that threatens our own species What can we do to change the current trajectory toward more climate change increased famine and epidemic disease Renowned Stanford scientists Paul R Ehrlich and Anne H Ehrlich believe that intelligently addressing those questions depends on a clear understanding of how we evolved and how and why we're changing the planet in ways that darken our descendants future The Dominant Animal arms readers with that knowledge tracing the interplay between environmental change and genetic and cultural evolution since the dawn of humanity In lucid and engaging prose they

describe how Homo sapiens adapted to their surroundings eventually developing the vibrant cultures vast scientific knowledge and technological wizardry we know today But the Ehrlichs also explore the flip side of this triumphant story of innovation and conquest As we clear forests to raise crops and build cities lace the continents with highways and create chemicals never before seen in nature we may be undermining our own supremacy The threats of environmental damage are clear from the daily headlines but the outcome is far from destined Humanity can again adapt if we learn from our evolutionary past Those lessons are crystallized in *The Dominant Animal* Tackling the fundamental challenge of the human predicament Paul and Anne Ehrlich offer a vivid and unique exploration of our origins our evolution and our future

Evolution in Changing Environments Richard Levins, 1968-08-21 Professor Levins one of the leading explorers in the field of integrated population biology considers the mutual interpenetration and joint evolution of organism and environment occurring on several levels at once Physiological and behavioral adaptations to short term fluctuations of the environment condition the responses of populations to long term changes and geographic gradients These in turn affect the way species divide the environments among themselves in communities and therefore the numbers of species which can coexist Environment is treated here abstractly as pattern patchiness variability range etc Populations are studied in their patterns local heterogeneity geographic variability faunistic diversity etc *Evolution and environment* Theodosius Grigorievich Dobzhansky, 1960 Organism and Environment Sonia E. Sultan, 2015 Over the past decade advances in both molecular developmental biology and evolutionary ecology have made possible a new understanding of organisms as dynamic systems interacting with their environments This innovative book synthesizes a wealth of recent research findings to examine how environments influence phenotypic expression in individual organisms ecological development or eco devo and how organisms in turn alter their environments niche construction A key argument explored throughout the book is that ecological interactions as well as natural selection are shaped by these dual organism environment effects This synthesis is particularly timely as biologists seek a unified contemporary framework in which to investigate the developmental outcomes ecological success and evolutionary prospects of organisms in rapidly changing environments *Organism and Environment* is an advanced text suitable for graduate level students taking seminar courses in ecology evolution and developmental biology as well as academics and researchers in these fields *Evolutionary Conservation Biology* Régis Ferrière, Ulf Dieckmann, Denis Couvet, 2004-06-10 As anthropogenic environmental changes spread and intensify across the planet conservation biologists have to analyze dynamics at large spatial and temporal scales Ecological and evolutionary processes are then closely intertwined In particular evolutionary responses to anthropogenic environmental change can be so fast and pronounced that conservation biology can no longer afford to ignore them To tackle this challenge areas of conservation biology that are disparate ought to be integrated into a unified framework Bringing together conservation genetics demography and ecology this book introduces evolutionary conservation biology as an integrative approach to managing

species in conjunction with ecological interactions and evolutionary processes Which characteristics of species and which features of environmental change foster or hinder evolutionary responses in ecological systems How do such responses affect population viability community dynamics and ecosystem functioning Under which conditions will evolutionary responses ameliorate rather than worsen the impact of environmental change

Life Strategies, Human Evolution,

Environmental Design V. Geist,2013-11-11 Consider that you were asked how to ensure human survival Where would you begin Conservation of resources jumps to mind We need to conserve resources in order that economic activities may continue Alas this is a false start Resources are always defined by a given economic system and only it determines what is and what is not a resource Therefore conserving resources implies only the perpetuation of the appropriate economic system Conservation of resources as we know them has nothing to do with the survival of mankind but it has very much to do with the survival of the industrial system and society we live in today We have to start therefore at a more basic level This level some may argue is addressed by ensuring for human beings clean genes Again this is a mistaken beginning It is thoroughly mistaken for reasons of science It is a false start because malfunctioning organs and morphological structures are not only due to deleterious hereditary factors but particularly due to unfavorable environments during early growth and development Moreover eugenics is not acceptable to any but a small fraction of society Eugenics may not be irrelevant to our future but is premature and should be of little concern until we understand how human genes and environment interact

Adaptation

and Environment Robert N. Brandon,2014-07-14 By focusing on the crucial role of environment in the process of adaptation Robert Brandon clarifies definitions and principles so as to help make the argument of evolution by natural selection empirically testable He proposes that natural selection is the process of differential reproduction resulting from differential adaptedness to a common selective environment Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

Big Questions in Ecology and Evolution Thomas N. Sherratt,David M. Wilkinson,2009-02-20 Why do we age Why cooperate Why do so many species engage in sex Why do the tropics have so many species When did humans start to affect world climate This book provides an introduction to a range of fundamental questions that have taxed evolutionary biologists and ecologists for decades Some of the phenomena discussed are on first reflection simply puzzling to understand from an evolutionary perspective whilst others have direct implications for the future of the planet All of the questions posed have at least a partial solution all have seen exciting breakthroughs in recent years yet many of the explanations continue to be hotly

debated Big Questions in Ecology and Evolution is a curiosity driven book written in an accessible way so as to appeal to a broad audience It is very deliberately not a formal text book but something designed to transmit the excitement and breadth of the field by discussing a number of major questions in ecology and evolution and how they have been answered This is a book aimed at informing and inspiring anybody with an interest in ecology and evolution It reveals to the reader the immense scope of the field its fundamental importance and the exciting breakthroughs that have been made in recent years

Macroevolution, Contingency, and Divine Activity Bradford McCall,2023-10-27 What are the things that God values in the creative process How does one define God s activity in such a world How is God s involvement different from a contingent what this author labels contingentist instance Why do we need a God idea at all Herein Bradford McCall addresses how divine amorepotent love works with and within a contingentist i e radically contingent evolutionary theory and worldview Within the course of this project he reaches a via media between the somewhat radical formalist position of Simon Conway Morris and the veritably radical contingent position of Stephen Jay Gould But how is the contingentist amorepotent and uncontrolling love of God understood as purposeful McCall argues in detail that there in fact is some sort of purposiveness that is nevertheless working in a chastened Gouldian position and he distinguishes between contingency and veritable divine involvement He contends that God does not insist upon a particular outcome but merely allows propensities to work themselves out God amorepotently loves the population of the natural world into greater forms of complexity relationality and beauty in varied and multifarious forms along with the extension of diversity

Engineering and Deployment of Cooperative Information Systems Yanbo Han,Stefan Tai,Dietmar Wikarski,2003-08-02 Today technologies for engineering and deployment of cooperative information systems have become increasingly critical in the construction of practically all types of large scale distributed systems Stimulating forums with different focuses are thus still in need of researchers and professionals from academia and industry to exchange ideas and experience and to establish working relationships The idea to organize in China an academic event focusing on current topics in the field was born during the IFIP World Computer Congress 2000 that was held in Beijing China And here are the proceedings of EDCIS 2002 This volume comprises the technical research papers accepted for presentation at EDCIS 2002 Of the initial 159 paper submissions involving nearly 500 authors from 14 countries

of all continents 45 papers were carefully selected Every paper was reviewed by at least three members of the program committee and judged according to its technical merit and soundness originality significance presentation quality and relevance to the conference The accepted papers cover various subjects such as workflow technology coordination technology advanced transactions groupware systems semantic web ontologies mobile agents and enterprise modeling and enterprise application integration

The Structure of Evolutionary Theory Stephen Jay Gould,2002-03-21

The world's most revered and eloquent interpreter of evolutionary ideas offers here a work of explanatory force unprecedented in our time a landmark publication both for its historical sweep and for its scientific vision With characteristic attention to detail Stephen Jay Gould first describes the content and discusses the history and origins of the three core commitments of classical Darwinism that natural selection works on organisms not genes or species that it is almost exclusively the mechanism of adaptive evolutionary change and that these changes are incremental not drastic Next he examines the three critiques that currently challenge this classic Darwinian edifice that selection operates on multiple levels from the gene to the group that evolution proceeds by a variety of mechanisms not just natural selection and that causes operating at broader scales including catastrophes have figured prominently in the course of evolution Then in a stunning tour de force that will likely stimulate discussion and debate for decades Gould proposes his own system for integrating these classical commitments and contemporary critiques into a new structure of evolutionary thought In 2001 the Library of Congress named Stephen Jay Gould one of America's eighty three Living Legends people who embody the quintessentially American ideal of individual creativity conviction dedication and exuberance Each of these qualities finds full expression in this peerless work the likes of which the scientific world has not seen and may not see again for well over a century
