Electricity Chp Technology Series:

Small and Micro Combined Heat and Power (CHP) Systems R Beith, 2011-04-30 Small and micro combined heat and power CHP systems are a form of cogeneration technology suitable for domestic and community buildings commercial establishments and industrial facilities as well as local heat networks One of the benefits of using cogeneration plant is a vastly improved energy efficiency in some cases achieving up to 80 90% systems efficiency whereas small scale electricity production is typically at well below 40% efficiency using the same amount of fuel This higher efficiency affords users greater energy security and increased long term sustainability of energy resources while lower overall emissions levels also contribute to an improved environmental performance Small and micro combined heat and power CHP systems provides a systematic and comprehensive review of the technological and practical developments of small and micro CHP systems Part one opens with reviews of small and micro CHP systems and their techno economic and performance assessment as well as their integration into distributed energy systems and their increasing utilisation of biomass fuels Part two focuses on the development of different types of CHP technology including internal combustion and reciprocating engines gas turbines and microturbines Stirling engines organic Rankine cycle process and fuel cell systems Heat activated cooling i e trigeneration technologies and energy storage systems of importance to the regional seasonal viability of this technology round out this section Finally part three covers the range of applications of small and micro CHP systems from residential buildings and district heating to commercial buildings and industrial applications as well as reviewing the market deployment of this important technology With its distinguished editor and international team of expert contributors Small and micro combined heat and power CHP systems is an essential reference work for anyone involved or interested in the design development installation and optimisation of small and micro CHP systems Reviews small and micro CHP systems and their techno economic and performance assessment Explores integration into distributed energy systems and their increasing utilisation of biomass fuels Focuses on the development of different types of CHP technology including internal combustion and reciprocating engines

Combined Cycle Driven Efficiency for Next Generation Nuclear Power Plants Bahman Zohuri, 2015-03-14 Introduces the concept of combined cycles for next generation nuclear power plants explaining how recent advances in gas turbines have made these systems increasingly desirable for efficiency gains and cost of ownership reduction Promulgates modelling and analysis techniques to identify opportunities for increased thermodynamic efficiency and decreased water usage over current Light Water Reactor LWR systems Examines all power conversion aspects from the fluid exiting the reactor to energy releases into the environment with special focus on heat exchangers and turbo machinery Provides examples of small projects to facilitate nuanced understanding of the theories and implementation of combined cycle nuclear plants This book explores combined cycle driven efficiency of new nuclear power plants and describes how to model and analyze a nuclear heated multi turbine power conversion system operating with atmospheric air as the working

fluid The included studies are intended to identify paths for future work on next generation nuclear power plants GEN IV leveraging advances in natural gas fired turbines that enable coupling salt cooled helium cooled and sodium cooled reactors to a Nuclear Air Brayton Combined Cycle NACC These reactors provide the option of operating base load nuclear plants with variable electricity output to the grid using natural gas or stored heat to produce peak power The author describes overall system architecture components and detailed modelling results of Brayton Rankine Combined Cycle power conversion systems and Recuperated Brayton Cycle systems since they offer the highest overall energy conversion efficiencies With ever higher temperatures predicted in GEN IV plants this book s investigation of potential avenues for thermodynamic efficiency gains will be of great interest to nuclear engineers and researchers as well as power plant operators and students
