Abstract

Open network management is assisted by representing the system resources to be managed as objects, and providing standard services and protocols for interrogating and manipulating these objects.

Application of formal techniques can make the specifications more precise, reducing the ambiguity inherent in natural language, and can automate some or all of the process of implementation and testing. This paper examines the use of formal description techniques to the specification of managed objects. In particular we examine the relative merits of two formal languages, Object-Z and RAISE, which have been proposed as suitable for use in object management.

Keywords: Managed objects, Formal methods, Open Distributed Processing.

1 Introduction

Large scale open systems require open management to integrate their components, which may have been obtained from a number of sources; the cost of system administration will depend to a large extent on how easy it is to perform this management integration. The creation of open network management depends upon there being a common representation for the resources being managed. This can be achieved by the creation of a suitable family of managed object definitions.

Different implementations of these managed objects, the agents that give access to them and the managers that control them need to interwork. Confidence in these implementations can be increased by testing. However, this testing is expensive and time consuming, because it is labour intensive.

At present the nature of the resources to be managed and the behaviour they are expected to exhibit are expressed in natural language, structured and organized using a simple specification technique set out in the Guidelines for the Definition of Managed Objects (GDMO) [GDMO]. The informal nature of this technique makes the implementation and testing of managed objects expensive, because much skilled effort is needed to interpret the specifications and construct suitable tests.
