Quantum Tunnelling in Enzyme-catalysed Reactions

Rudolf Konrad Allemann, Nigel S. Scrutton, 2009 In recent years there has been an explosion in knowledge and research associated with the field of enzyme catalysis and H tunneling Rich in its breath and depth this introduction to modern theories and methods of study is suitable for experienced researchers those new to the subject Edited by two leading experts and bringing together the foremost practitioners in the field this up to date account of a rapidly developing field sits at the interface between biology chemistry and physics It covers computational kinetic and structural analysis of tunnelling and the synergy in combining these methods with a major focus on H tunneling reactions in enzyme systems The book starts with a brief overview of proton and electron transfer history by Nobel Laureate Rudolph A Marcus The reader is then guided through chapters covering almost every aspect of reactions in enzyme catalysis ranging from descriptions of the relevant quantum theory and quantum classical theoretical methodology to the description of experimental results The theoretical interpretation of these large systems includes both quantum mechanical and statistical mechanical computations as well as simple more approximate models Most of the chapters focus on enzymatic catalysis of hydride proton and H transfer an example of the latter being proton coupled electron transfer There is also a chapter on electron transfer in proteins This is timely since the theoretical framework developed fifty years ago for treating electron transfers has now been adapted to H transfers and electron transfers in proteins Accessible in style this book is suitable for a wide audience but will be particularly useful to advanced level undergraduates postgraduates and early postdoctoral workers

Catalysis and Control Daniel L. Purich, 2010-06-16 Far more than a comprehensive treatise on initial rate and fast reaction kinetics this one of a kind desk reference places enzyme science in the fuller context of the organic inorganic and physical chemical processes occurring within enzyme active sites Drawing on 2600 references Enzyme Kinetics Catalysis Control develops all the kinetic tools needed to define enzyme catalysis spanning the entire spectrum from the basics of chemical kinetics and practical advice on rate measurement to the very latest work on single molecule kinetics and mechanoenzyme force generation while also focusing on the persuasive power of kinetic isotope effects the design of high potency drugs and the behavior of regulatory enzymes Historical analysis of kinetic principles including advanced enzyme science Provides both theoretical and practical measurements tools Coverage of single molecular kinetics Examination of force generation mechanisms Discussion of organic and inorganic enzyme reactions

Organic Chemistry of Enzyme-Catalyzed Reactions, Revised Edition Richard B. Silverman, 2002-03-07 The Organic Chemistry of Enzyme Catalyzed Reactions is not a book on enzymes but rather a book on the general mechanisms involved in chemical reactions involving enzymes An enzyme is a protein molecule in a plant or animal that causes specific reactions without itself being permanently altered or destroyed This is a revised edition of a very successful book which appeals to both academic and industrial markets Illustrates the

organic mechanism associated with each enzyme catalyzed reaction Makes the connection between organic reaction mechanisms and enzyme mechanisms Compiles the latest information about molecular mechanisms of enzyme reactions Accompanied by clearly drawn structures schemes and figures Includes an extensive bibliography on enzyme mechanisms covering the last 30 years Explains how enzymes can accelerate the rates of chemical reactions with high specificity Provides approaches to the design of inhibitors of enzyme catalyzed reactions Categorizes the cofactors that are appropriate for catalyzing different classes of reactions Shows how chemical enzyme models are used for mechanistic studies Describes catalytic antibody design and mechanism Includes problem sets and solutions for each chapter Written in an informal and didactic style

Advanced Biology Michael Kent, 2000-07-06 Written by an experienced teacher of students this book aims to motivate A Level students Questions are presented in two styles Quick Check and Food for Thought to give opportunities to practise both recall and analytical skills It includes colour illustrations and graduated questions to practise recall and analytical skills

Introduction to Enzyme and Coenzyme Chemistry T. D. H. Bugg, 2012-05-29 Enzymes are giant macromolecules which catalyse biochemical reactions They are remarkable in many ways Their three dimensional structures are highly complex yet they are formed by spontaneous folding of a linear polypeptide chain Their catalytic properties are far more impressive than synthetic catalysts which operate under more extreme conditions Each enzyme catalyses a single chemical reaction on a particular chemical substrate with very high enantioselectivity and enantiospecificity at rates which approach catalytic perfection Living cells are capable of carrying out a huge repertoire of enzyme catalysed chemical reactions some of which have little or no precedent in organic chemistry The popular textbook Introduction to Enzyme and Coenzyme Chemistry has been thoroughly updated to include information on the most recent advances in our understanding of enzyme action with additional recent examples from the literature used to illustrate key points A major new feature is the inclusion of two colour figures and the addition of over 40 new figures of the active sites of enzymes discussed in the text in order to illustrate the interplay between enzyme structure and function This new edition provides a concise but comprehensive account from the perspective of organic chemistry what enzymes are how they work and how they catalyse many of the major classes of enzymatic reactions and will continue to prove invaluable to both undergraduate and postgraduate students of organic bio organic and medicinal chemistry chemical biology biochemistry and biotechnology

The Enzyme Catalysis Process A. Cooper,2013-12-11 This volume represents the proceedings of a NATO Advanced Studies Institute held near Barga Italy July 11 23 1988 involving over 90 participants from more than twelve countries of Europe North America and elsewhere It was not our intention at this meeting to present a complete up to the minute review of current research in enzyme catalysis but rather in accord with the intended spirit of NATO ASIs to give an opportunity for advanced students and researchers in a wide variety of disciplines to meet together and study the problem from different points of view Hence the lectures cover topics ranging from the purely theoretical aspects of chemical reaction kinetics in condensed matter through practical experimental approaches to enzyme structure dynamics and mechanism including the new experimental opportunities arising from genetic engineering techniques Our approach was unashamedly physical both because the more biochemical aspects of enzymology are amply covered elsewhere and because progress in our understanding and application of the molecular basis of enzymic processes must ultimately come from advances in physical knowledge We tried to cover as wide a spectrum as possible and succeeded in gathering an expert and enthusiastic team of speakers but there are some inevitable omissions In particular and with hindsight our discussions might have been enriched by more detailed coverage of general aspects of chemical catalysis but readers requiring this background should find adequate references herein **The Organic Chemistry of Enzyme-catalyzed Reactions** Richard B. New Trends in Enzyme Catalysis and Biomimetic Chemical Reactions Gertz I. Likhtenshtein, 2003 Enzyme catalysis is an important and vigorously developing field of basic and applied research posing challenging problems to biochemists and chemists This volume embraces modern areas of enzyme catalysis where other books in the field concentrate mainly on kinetic bioorganic and biochemical aspects of the enzyme catalysis and do not cover biophysical and physicochemical problems Topics covered include modern physical and kinetic methods of investigation contemporary theories of elementary chemical processes in enzymes structure dynamics and action mechanism of enzyme active sites concept of pretransition state theory of long range electron transfer and proton translocation mechanisms of tough biochemical reactions dinitrogen reduction light energy conversion water photooxidation hydroxylation the achievements and problems of biomimetic chemical reactions
