## Understand Your Horse's Vision and Common Eye Disorders

BY KIRBY PENTTILA, DVM

**A**s a prey species, the horse relies on sensory stimulus such as sight, smell, and sound for defense against predation. Perhaps the most important of these sensory organs is the equine eye, which has several unique adaptations to allow horses to obtain and interpret information about their surroundings and decide whether or not to engage the fight-or-flight response they employ for survival. Given that horses rely so heavily on vision for this response, any disorders that may affect vision or the health of the eye must be treated as soon as possible to help preserve optimal vision and eye function.

### **Anatomy - Form & Function**

The equine eyes are located on either side of the head, in what are known as the orbits, or the bony sockets of the skull. The lateral location of the bony orbits within

the horse's skull allows for better peripheral vision. The eye is protected externally by the eyelids, the eye lashes, and the long hairs known as vibrissae above and below the eye. The third eyelid (also referred to as the nictitans) is located at the medial canthus, and helps to protect the cornea and distribute tear film across the eye (see Figures 1a,b). The anterior segment of the eye is composed of the cornea, iris, lens, and ciliary body. The uvea is composed of the iris, ciliary body, and the choroid. The posterior segment (also known as the fundus) of the eye comprises the vitreous, retina, and choroid. The anterior and posterior segments of the eye are divided by the iris, ciliary body and the lens. Each of the structures of the equine eye play an important role in maintaining vision, and damage to any one of these structures can have devastating consequences.
