Epitope Mapping A Practical Approach:

Epitope Mapping Olwyn M. R. Westwood, Frank C. Hay, 2001 Epitope Mapping covers all the major methods for the identification and definition of epitopes This book is intended for researchers in academia and industry involved with epitope mapping

Colloidal Biomolecules, Biomaterials, and Biomedical Applications Abdelhamid Elaissari, 2003-10-21 Colloidal Biomolecules Biomaterials and Biomedical Applications is an authoritative presentation of established and recent techniques promising to revolutionize the areas of biomedical diagnostics therapeutics pharmaceuticals and drug delivery This exceptional book details an original homogeneous assay for biomolecule detection and capture through duplex colloid particles as well as new methods for utilizing peptides in particle agglutination Featuring contributions from over 30 prominent researchers it investigates physical studies of the agglutination of sensitive latexes and indicates benefits to drug delivery through supercritical fluid process production of polymer particles

Molecular Biomethods Handbook Ralph Rapley, John M. Walker, 2007-10-09 An authoritative team of investigators illuminate the core bioanalytical techniques used every day in their own laboratories and laboratories throughout the world These highly experienced scientists fully explain both the theory behind and the application of these key techniques and include extensive references for those seeking detailed laboratory protocols The techniques covered range from the extraction separation detection and characterization of nucleic acids to gene cloning and library production mapping expression transgenesis differential display and DNA profiling to name a few Numerous key protein methods as well as support and related techniques are also included The goal is to provide established scientists and novices who are new to these techniques with a deeper understanding of the widest variety of biotechniques and their applications

Peptide Antigens G. Brian Wisdom, 1994 Peptide antigens and their antibodies have been widely exploited for the measurement location and purification of oligopeptides such as peptide hormones Recently the use of peptides to mimic substructures of proteins has led to major expansion in the application of anti peptide antibodies These have been especially important in identifying the characterizing proteins which are only known by their primary structure derived from a DNA sequence Another area of recent expansion is the use of defined peptided antigens to identify and map antibodies and T cell receptors This book provides information and detailed protocols for the main techniques for exploitation of peptide antigens and anti peptide antibodies and will interest research workers in many fields

Embryonic Stem Cells Kursad Turksen, 2008-02-02 It is fair to say that embryonic stem ES cells have taken their place beside the human genome project as one of the most discussed biomedical issues of the day It also seems certain that as this millennium unfolds we will see an increase in scientific and ethical debate about their potential utility in society On the scientific front it is clear that work on ES cells has already generated new possibilities and stimulated development of new strategies for increasing our und standing of cell lineages and differentiation It is not na ve to think that within a decade or so our overall understanding of stem cell biology will be as revolutionized as it was when the pioneering hemopoietic stem cell studies of Till and

McCulloch in Toronto captured our imaginations in 1961 With it will come better methods for ES and lineage specific stem cell identification maintenance and controlled fate selection Clearly ES cell models are already providing opportunities for the establishment of limitless sources of specific cell populations In recognition of the growing excitement and potential of ES cells as models for both the advancement of basic science and future clinical applications I felt it timely to edit this collection of protocols Embryonic Stem Cells in which forefront investigators would provide detailed methods for use of ES cells to study various lineages and tissue types

Immunogenicity of Biopharmaceuticals Marco Weert, Eva Horn Møller, 2008-02-06
A particular issue for biopharmaceuticals that has not been addressed comprehensively in any book is the potential of an immune response to the biopharmaceutical product That is the human body marks the drug as a foreign body and develops antibodies against the drug These antibodies may be relatively harmless but may also cross react with the endogenous compound causing autoimmunogenicity Recent adverse experiences in Europe with Janssen Ortho's blockbuster product Eprex has increased the attention towards potential immunogenicity of biopharmaceuticals above all from the regulatory agencies This book is intended to give a broad overview of the current state of the art regarding the immune response to biopharmaceuticals The chapters range from an overview of the immune system and factors that may trigger the immune system via detection of antibodies and clinical implications to various case examples and the regulatory view on immunogenicity

Analysis of RNA-Protein Complexes in vitro J. Kjems, J. Egebjerg, J. Christiansen, 1998-11-13
The central role of RNA in many cellular processes in biotechnology and as pharmaceutical agents has created an interest in experimental methods applied to RNA molecules This book provides scientists with a comprehensive collection of thoroughly tested up to date manuals for investigating RNA protein complexes in vitro The protocols can be performed by researchers trained in standard molecular biological techniques and require a minimum of specialized equipment The procedures include recommendation of suppliers of reagents

Data-Driven Vaccine Design for Microbial-Associated Diseases Gurudeeban Selvaraj, Satyavani Kalamurthi, Dongqing Wei, 2026-02-02
Vaccination is one of the greatest achievements in immunology and medicine nearly eradicating many infectious diseases that once harmed humanity It introduces a form of a pathogen into the body enabling the immune system to develop a memory response for protection against future infections Traditionally vaccine development has followed empirical methods and time consumption but some pathogens have evolved to evade these approaches To address these challenges we need interdisciplinary strategies integrating engineering immunology and physical sciences in vaccine development The Research Topic titled Data Driven Vaccine Design for Microbial Associated Diseases explores the role of data driven approaches in designing vaccines for infectious diseases and cancers caused by pathogenic microbes Further this issue emphasizes the integration of genomics proteomics transcriptomics immunomics structural and synthetic biology data alongside data from computer simulations bioinformatics analyses and systems biology Additionally it highlights

the use of machine learning models to predict immune responses and antigen structures ultimately improving vaccine design and development efficiency Emerging and harmful microbes include severe acute respiratory syndrome related coronavirus Monkeypox Avian influenza Human Immunodeficiency Virus Hepatitis B and C viruses Mycobacterium tuberculosis Human Papillomavirus Epstein Barr virus Helicobacter pylori Schistosoma haematobium and many more that cause a wide range of infectious diseases and deadly cancers These pathogens pose significant challenges due to their high mutation rates making it difficult to develop universal vaccines The available vaccines for some specific pathogens offer limited protection require multiple doses or show reduced effectiveness in immunocompromised individuals Additionally no approved vaccines are available for most of the highly mutated microbes with complex structural proteins The pathogens complex life cycles latency periods and immune evasion mechanisms further complicate vaccine development Although strain specific vaccines for HPV related cancers are available they are primarily prophylactic To overcome these limitations data driven and computational approaches are being applied to the design of epitope based vaccines including peptide and RNA vaccines Epitopes the parts of pathogens recognized by the immune system are essential in both peptide and RNA vaccines as they determine the immune response s specificity strength and duration Whether delivered as peptides or encoded by mRNA epitopes are crucial in guiding the immune system to recognize and eliminate pathogens effectively Data driven methods help identify the most promising epitopes accelerating the development of novel vaccine candidates This special issue highlights how multi omics data and AI driven tools can aid in identifying key microbial antigens leading to the creation of more effective epitope based vaccines for a range of challenging diseases This Research Topic accepts Original Research Systematic Review Methods Review and Mini Review Technology and Code Brief Research Report and Opinion We welcome manuscripts focusing on but not limited to the following sub topics Antigens Artificial intelligence Cancer vaccines Data driven design Epitopes Immunoinformatics Infectious diseases Machine learning models mRNA Multi omics Genomics transcriptomics immunomics and proteomics Mutation and pathogen evolution Structural modeling and Molecular dynamics simulation Systems biology Toll like receptors and vaccine efficacy
